LETTER TO THE EDITOR:

Sustainable Health Care Must Be the Next Patient Safety Movement

by Jonathon P. McBride, MD, MS, and Matthew J. Meyer, MD

The harm done by health-care-related pollution is equivalent to the medical errors that sparked the patient safety movement.\(^1\) Anesthetic gas are one of the largest and most modifiable sources of health care sector greenhouse gas (GHG) emissions.\(^2\) Anesthesia professionals have the opportunity to lead the health care sector’s response to pollution and climate change.

Last summer, an older woman living in the usually mild climate of British Columbia suffered dyspnea following an extraordinary heatwave—her physician diagnosed her with “climate change.”\(^3\) While she is the first known to receive the diagnosis of climate change, she is not the first patient whose health has suffered because of climate change.\(^4\) She will not be the last.

Climate change is already affecting the health of our patients. Yet, the health care sector is just beginning to understand the impact of environmental health on population health, and to evaluate its large contribution to global emissions and climate-related morbidity.\(^4-6\)

IMPACT OF ANESTHESIOLOGY ON OUR ENVIRONMENT

The modern health care sector is responsible for an estimated 8.5% of United States GHG emissions; pollution that harms the very people the health care sector cares for (Figure 1).\(^6,7\) It is essential for the entire health care sector to evaluate and reduce its impact on the environment. Responding to climate change, and its downstream population health impact, is an opportunity for anesthesia professionals to lead on patient safety once again.

Pharmaceutical-related emissions account for approximately 20% of health care sector GHG emissions, more than food service, construction, or transportation.\(^5\) Volatile anesthetics and nitrous oxide can trap hundreds to thousands of times more energy than carbon dioxide.\(^8\) One study found anesthetic gasses could be the source of over 50% of the GHG footprint of the entire operating room (OR) suite.\(^2\)

Desflurane\(^9\) and nitrous oxide\(^10\) have the highest impact on climate change due to their energy trapping ability and the concentration at which they are used clinically; sevoflurane is the least harmful, but still multiple times worse than the potent GHG methane. In a study comparing the GHG emissions per Minimum Alveolar Concentration (MAC)-hour of anesthesia, propofol is orders of magnitude less impactful on the climate than any volatile anesthetic.\(^8\)

Adding to the harm of nitrous oxide, a recent study found in-hospital delivery of nitrous oxide to be dangerously inefficient with upwards of 70% of procured nitrous oxide being lost via leakage.\(^11\) The loss of nitrous oxide from hospital storage to OR utilization is a potential patient and occupational safety issue.

Making modifications to the delivery of anesthesia care (Figure 2) provides an opportunity to reduce our profession’s environmental impact and provide higher value patient care. For example, a multidisciplinary OR green team including anesthesia professionals at the University of Wisconsin Health educated the anesthesiology department on anesthetic gas waste, low-flow anesthesia,\(^12\) and differential GHG emissions of volatile anesthetics. Anesthesia Professionals Can Reduce Environmental Harm and Improve Patient Safety

From “Sustainable Health Care,” Preceding Page

three years they reduced their GHG emissions 64% per case while saving $25,000 per month.15 Furthermore, even if a health system institutes sustainable anesthesia practices like low fresh gas flows (<1L per minute), reusable instruments, and the elimination of desflurane and nitrous oxide, there is still an opportunity for the attentive, individual anesthesia professional to make a notable impact.14

**HOW TO GET INVOLVED?**

As global priorities shift and patients and organizations demand a more sustainable economy, health care will have to change. The current practice of medicine is unsustainable. In an unprecedented call to action, over 200 organizations demand a more sustainable economy, health care will have to change. The Lance

*The health care sector is responsible for one-sixth of the entire US GDP, creating sustainable health care systems can catalyze change throughout the entire economy. Anesthesia professionals have the opportunity to reduce the environmental harm of our practice and again take a leading role in this next patient safety movement.*

Jonathon P. McBride, MD, MS, is an incoming anesthesiology resident at the University of Michigan.

Matthew J. Meyer, MD, is an assistant professor of anesthesiology at the University of Virginia.

Matthew J. Meyer, MD, has consulted for Dialectica and received speaking fees from Takeda Pharmaceutical for a science forum on sustainability. Dr. Meyer has intellectual property related to perioperative efficiency and sustainability. Matthew J. Meyer, MD, is on the steering-committee of Virginia Clinicians for Climate Action. Jonathon P. McBride, MD, is a member of White Coats for Planetary Health and Medical Students for a Sustainable Future.
